Questionnaire – ECCO

### 1 UNIFIED CONCEPTUAL MODEL

The unified conceptual model (Figure 1) describes essential concepts for modeling variability of a software system in space (variants) and time (revisions). It follows an open-world assumption (descriptive) instead of a closed-world assumption (prescriptive).

In Table 1, we provide a definition of the involved concepts.

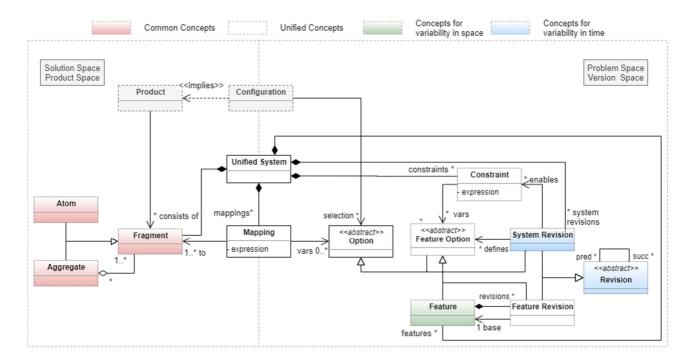

Figure 1: The Conceptual Model with common and unified Concepts for Variability in Space and Time.

Table 1: Definition of concepts in the Conceptual Model.

Concept	Relation to other	Definition
	Concepts	
Fragment	Product, Unified	Fragments are the essential concept to describe a system on
	System, Mapping	implementation level. A Fragment can either be an atom or
		an aggregate, e.g. a single file, character or the node of an
		AST. We explicitly do not specify the level of granularity for
		an atom or aggregate to remain as generic as possible. A
		hierarchical structure of containments is not enforced.
		Instead, Fragments can be composed to various
		combinations.

Product	Configuration,	A <i>Product</i> is implied by a configuration. A <i>Product</i> is not part
	(consists of *)	of the system's state but can be computed from it based on
	Fragment	the configuration.
Unified System	(Contains *) Fragment,	The <i>Unified System</i> represents the unified configurable
_	Mapping,	space regarding spatial and temporal variability. It subsumes
	Configuration,	concepts from both solution and problem space.
	Constraint, Feature,	
	System Revision	
Mapping	Unified System, (has *)	A <i>Mapping</i> is an arbitrary expression (e.g., Boolean formula)
	Option variables,	that consists of <i>Option</i> variables that are mapped to
	(references 1*)	fragments. Therefore, the Mapping connects concepts from
	Fragment	the solution space (fragments) to concepts in the problem
		space (options).
Option	Configuration,	An <i>Option</i> expresses the variability of a system. This can
	Mapping, Feature	either manifest as variability in space (i.e., <i>Feature</i> ) or
	Option, System	variability in time (i.e. System Revision or Feature Revision).
	Revision	
Feature Option	(Extends) Option,	A Feature Option represents the configurable space on
	Constraint, System	feature level.
	Revision, Feature,	
	Feature Revision	
Feature	(Contains *) Feature	" A prominent or distinctive user-visible aspect, quality, or
	Revision	characteristic of a software system or systems [1]"
Revision	(Has *) predecessor	A Revision evolves along the time dimension and is intended
	and successor	to supersede its predecessor by an increment, e.g., due to a
	Revision	bug fix or refactoring. This relation forms a revision graph,
		which is a directed acyclic graph (DAG) with each node
		representing a unique revision.
System	(Extends) Revision,	A System Revision extends the Revision and represents the
Revision	(defines *) Feature	evolutionary state of the entire system at one point in time.
	Option, (enables *)	This state involves the definition of Features and Feature
	Constraint	Revisions (e.g., System Revision 2 involves feature A in
		revision 1 and Feature B in revision 2) along with Constraints
		that are valid for the respective System Revision.
Feature	(has 1 base) Feature,	A Feature Revision extends the Revision and represents an
Revision	(extends) Feature	evolutionary state of one particular <i>Feature</i> at one point in
	Option, (extends)	time.
	Sparsin, (externes)	""" - "

Configuration	(Has a selection of *)	A Configuration implies one particular Product of the Unified
	Options, implies	System and consists of a selection of Option variables. It is
	Product	not part of the system's state.
Constraint	Unified System,	The Constraint is an arbitrary expression (e.g., Boolean
	System Revision, (has	formula) that constrains <i>Feature Options</i> that can be
	*) Feature Option	combined in a Configuration.

# 2 MAPPING

To assess the mapping between concepts and relations of the unified conceptual model regarding the selected tool, each concept and relation is considered separately. For the sake of simplicity, we omit inheritance relationships.

## 2.1 CONCEPTS

For each concept of the conceptual model listed in Table 3, please inspect whether an equivalent construct exists in your tool and complete the form according to the following scheme in Table 2:

Table 2: Exemplary Mapping of ECCO (incomplete).

Concept in	Maps to Construct	Does not map /	Please comment, if concept is only
Model	(Name)	Does not exist	partially reflected
Fragment	Artifact	-	-
Product	-	✓	Because it is not part of the state of the
			system but exists as output in the form
			of files in the file system.
System Revision	-	✓	ECCO considers Feature Revisions
			only.
